VM Cloning Instructions

1. To create a virtual Windows machine (without having to go through all the installation process):
   - **Login** to one of the shakespeare servers: othello hamlet lear macbeth cleopatra antony edmund caesar
   - **Create a virtual machine space** as usual:
     - example: `citv createvm win_clone_8G 128 8 2054` (you don’t need more than 128M of RAM).
     - You could also use the web interface.
   - **Now that you have a space for it created, we will copy a pre-existing image over the one you just created.** I will use a windows system, but you could do any pre-existing image.
     - `ssh saturn`
     - `cd /c/qemu/images/`
     - `ls <your username>*` (ex: `ls jfrancom*`). **NOTE THE ASTERISK IN THE PRECEEDING COMMAND.** This allows you to see what your entire image name is called. Mine is `jfrancom-jfrancom-win_clone_8G.img`
     - Issue the following command, making sure that you substitute your filename (from the above step, as the copy to destination):
       ```
cp --sparse=always src dest where src = 000_WINDOWS_IMAGE_COPY_ME.img and dst = whatever your new image name is (ie jfrancom-jfrancom-image.img)
```
     - Should then be able to boot your image:
       ```
citv bootvm win_clone_8G c win_xp (substituting your image name)
```
2. You can do this with ANY image that is in the images directory. So if you want to clone your own, you can do so!
